

Door Glass.

The 5 mm tempered and tinted door glass forms part of a fully framed electrically operated system. A switchpack installed in each door casing provides control of lowering and raising of that particular door glass with additional 'one-shot' fast lowering. The driver's door switchpack also provides for independent control of each passenger door glass and total isolation of all passenger door glass control. Each door glass is raised and lowered by an electrically operated scissor mechanism. All door glass can only be operated when the ignition switch is in position I or II.
